BioMed-Potassium

Colorimetric, Endpoint

REF: POT100100 (2x50 ml)
POT100040 (2 x 20 ml)

INTENDED FOR USE:
For the quantitative determination of Potassium in serum.

PRINCIPLE:
The amount of potassium is determined by using sodium tetraphenylboron in a specifically prepared mixture to produce a colloidal suspension. The turbidity of which is proportional to concentration of K+ in the range of 2-7 mEq/L.

SPECIMEN COLLECTION:
Freshly drawn non hemolysed serum is the specimen of choice. Serum Potassium is stable for atleast 24 hours at room temperature and two weeks at 2-8°C. Serum or heparinised plasma, CSF & Urine. Urine diluted 1+1 with distilled water can be used for chloride estimation. Chloride in serum is stable for 7 days at 2-8°C.

REAGENT COMPOSITIONS:

| R1 Standard | Potassium | 5 mEq/l |
| R2 Color Reagent | Sodium tetraphenylboron | 0.2nmol/L |

PACKAGE: Collection and storage.
Store all reagents at +2-8°C the reagents are stable until the expiration date as indicated on the label.

PRECAUTIONS & WARNING:
Avoid pipette with mouth.
The preparation, according to current regulation, is classified as not dangerous.
The total concentration of non active components (preservatives, detergents, stabilizers) is below the minimum required for citation.
Anyway handle with care, avoid ingestion, avoid contact with eyes, skin and mucous membranes. The samples must be handle as potentially infected from HIV or Hepatitis.

REAGENT PREPARATION & STABILITY:
Liquid reagents must be at room temperature (+15-25°C) before using.

REQUIRED MATERIALS NOT PROVIDED:
General Laboratory Equipment and instrumentations.

PROCEDURE:

Wavelength: 623nm (620-640)
Optical path: 1 cm light path
Temperature: +25/30/37°C.
Reading: Against reagent blank
Assay type: End Point

Mix, incubate for 5 min at room temperature (+15-25°C.) Read the absorbance of standard and sample tubes.
Volumes can be proportionally modified.
This methodology describes the manual procedure to use the kit.
For automated procedure, ask for specific application.

CALCULATION:

Potassium mEq/l = \[
\frac{(A) \text{ Sample}}{(A) \text{ Standard}} \times 5.0
\]

EXPECTED VALUE:

Serum: 3.4 - 5.5 mEq/l

The above mentioned values are to be considered as a reference. It is strongly recommended that each laboratory establish its own normal range according to its geographic area, according to IFCC protocol.

WASTE DISPOSAL:
The disposal of the product must be in accordance with local regulation concerning waste disposal.
QUALITY CONTROL:
It is recommended to execute the quality control at every kit utilization to verify that values are within the reference range indicated by the methodology.

INTERFERENCE:
Turbid or icteric serum produce falsely elevated results.

Linearity:
The assay is linear up to Potassium 7 mEq/l
